## Webapp Mobiles

*Créateur de sites et applications mobiles*

Envie d'être présent sur tous les smartphones de vos clients ?

**Afin d'optimiser votre application et augmenter votre visibilité, nous vous proposons d'apposer votre QRCode sur nos supports malins et efficaces.**

Des différents **réseaux de professionnels**, en passant par la restauration ou l'hôtellerie, soyez « **barcodé** » de tous et **récupérez ainsi une clientèle de consommateurs** en quête de bonnes adresses, de bons services et d'offres promotionnelles des professionnels alentours.

**Webapp Mobiles par Editions Conseil**  
Spécialiste de la communication intelligente

Idéal pour les PME, commerces, associations, manifestations... **Webapp Mobiles** est la solution la plus simple pour vous, d'acquies un site et une application mobile **clé en main** en fonction de vos envies et de vos besoins.

Compatible avec tous types de Smartphones et tablettes, vous serez vu de tous en un **simple clic**.

Grâce à votre **QRCode unique**, ou via votre adresse URL, chacun de vos clients pourra avoir accès à vos articles, galeries photos, vidéos, géolocalisation, bon de commande... sans aucun téléchargement préalable.

En véritable vitrine dynamique, tous les mois, actualisez vos contenus et faites de nouvelles offres pour attirer de nouveaux clients. De plus, **fidélisez votre clientèle** avec le raccourci de votre appli visible en permanence sur leur Smartphone. En vous abonnant à nos forfaits « mise à jour » vous avez la possibilité de choisir à quelle fréquence vous voulez changer vos contenus.

**Et en plus, les meilleurs réseaux de distribution vous seront proposés !**

## Antimony Trioxide

May 2012

**Summary**

Antimony is a metal that occurs naturally in the earth's crust. The most important form of antimony is antimony trioxide (commonly known as ATO, chemical formula Sb<sub>2</sub>O<sub>3</sub>). It is used in a wide variety of industrial applications, principally as a "synergist" with flame retardant manufacture of polyester (PET). The total global consumption of ATO in 2011 was approximately 135,000 tons.

**Applications**

ATO is the material of choice in several applications due to its unique properties.

**1. Synergist with flame retardants**

Over the last few decades, fire safety in our homes and public places has improved greatly, thanks mainly to international standardisation efforts in electrical and electronic equipment and transportation. These standards specify that inherently flammable materials should be made fire safe to a high degree, which often requires the use of flame retardant chemicals. ATO greatly enhances the effectiveness of flame retardants, when used as a synergist in combination with halogenated flame retardants in plastics, paints, adhesives, sealants, rubber and textile back coatings.

ATO is so used in many appliances within our homes and offices. TVs, computers, household appliances, industrial electrical installations, optical cables, mobile phones and portable electronics and in fire safe plastic casings, main circuit boards, switches and components. It is incorporated into upholstered furniture, insulation and decorative foams and building materials, and is used in clothing where fire is a risk, for example, children's nightwear and hospital linen as well as in technical fire-resistant textiles for professional uses. In transport vehicles its role as a flame retardant in seats, cables and plastic structures facilitates more time to escape should a fire occur. Thousands of tons have been saved and tens of thousands of buildings from disaster have been avoided by the use of antimony trioxide as a flame retardant synergist. Statistics: UK Department of Trade and Industry (Effectiveness of the Furniture and Furnishings (Fire Safety) Regulations 1988, London, June 2005, LFN 05760).

## Reach

May 2012

**About Reach**

REACH (Registration, Evaluation, Authorisation and Restriction of Chemicals) is the EU Regulation (EC) No 1907/2006 that entered into force on 1st June 2007. It replaced the existing European risk assessment system, amongst others. The REACH regulation is subject to revisions and can be found on the European Chemicals Agency (ECHA) website.

The REACH regulation applies to all companies manufacturing or importing substances in the EU at a 1 tonne/year. This regulation places greater responsibility on companies – they are obliged to identify and manage risks from all REACH compliant substances to ensure safe handling and use of the substances by humans and for the environment. Companies are required to gather data on the properties of their chemical substances, and to register this information on a central database run by the European Chemicals Agency (ECHA). ECHA acts as the central point in the REACH system: it manages the databases necessary to operate the system, co-ordinates the in-depth evaluation of "suspect" chemicals and is building up a public database in which consumers and professionals can consult on hazard information. The relevant information on the safe handling and use of substances has to be provided to downstream users in so-called Safety Data Sheets (SDS).

**Table of Contents**

- About Reach 1
- i2a and REACH 2

**Pre-Registration**  
Manufacturers and importers had to pre-register substances already on the EU market (1 June 1 Dec 2008).

**Registration**  
Manufacturers and importers of chemical substances (1 tonne/year) must obtain information on the physicochemical, health and environmental properties of their substances and use it to determine how these substances can be used safely. Each manufacturer and importer must submit a registration dossier to ECHA. Each dossier depends on tonnage band and the hazard properties of the substance.

**Evaluation**  
ECHA will evaluate each dossier to assess testing proposals made by the registrant or to check that the registration dossier complies with the requirements.

**Authorisation**  
Required for the prioritised substances of very high concern (SVHC) that are included in Annex XV. Companies applying for authorisation will have to demonstrate that risks associated with uses of these substances are adequately controlled or that the socio-economic benefits from their use outweigh the risks and will also have to investigate the possibility of substituting these substances with safer alternatives.

**Restriction**  
The European Union can impose restrictions, and prohibit or set conditions for the manufacture, placing on the market or use of certain dangerous substances or group of substances when unacceptable risks to humans or the environment have been identified.
